

Parametric Pseudo-Manifolds

Daniel Krupka and Gabe Naghi

Surface Approximation

- Space is continuous, data is discrete
- Approximations can be made
 - Meshes - more triangles
 - Parametric surfaces - control points
- 'Good' approximation is problem-specific
- Some problems are just that big

PPMs - A Hybrid Approach

- Method of gluing approximations¹
- Assemble Bezier patches into full surface
- Bonus features
 - Not iterative, re. Subsurf
 - Random access
 - Separate topology from data

PPMs Illustrated

Inherent Parallelism

- Geometry is variable but local, math is per-patch
- Topology is constant
- Split into topology pre-processing + tight nondivergent geometry loop

PPM Calculation Stages

Demo

Backup - PPM Examples

Next Milestones

- Milestone 2: Optimize violently
- Milestone 3: Bugfixing + profiling
- Final: Maybe extra features?
 - Deformation
 - Normal interpolation
